

SKYCALC Sky Model Calculator

Sky Model Mode [Version 2.0.9](#)

[Description](#)

[FAQ](#)

Input Configuration

Observatory Height : 2640m above sea level

Altitude : 70.0

Airmass : 1.06

Season : Dec/Jan

Time Period : 1/3 of Night

PWV : 1.00 mm

Monthly Averaged Solar Radio Flux : 150.00 sfu

Components included in the radiance model:

Scattered Moonlight:

separation of Sun and Moon : 111 degrees
 separation of Moon and object : 106 degrees
 altitude of Moon above horizon : -29 degrees
 distance to Moon : 0.995

Scattered Starlight

Zodiacal Light:

heliocentric ecliptic longitude of object : -59 degrees
 ecliptic latitude of object : 29 degrees

Molecular Emission of Lower Atmosphere

Emission Lines of Upper Atmosphere

Airglow/Residual Continuum

Thermal Emission: (see section 6.2.4 in the [documentation](#))

T₁ : 275.0 K , E₁ : 0.25

T₂ : 70.0 K , E₂ : 0.27

T₃ : 70.0 K , E₃ : 0.00

Wavelength grid:

Range: 1900.00 nm - 2600.00 nm

Fixed spectral resolution R=300000

Wavelengths in Air or Vacuum : Air

LSF convolution kernel: Gaussian FWHM=2.00 bins

Output

Download the resulting model spectra as FITS table: [skytable.fits](#)
